Version 1.0.1 released

We are pleased to announce an update of MokaFive Creator and Player for all platforms. Version 1.0.1 has a number of improvements and fixes:

Upgraded to VMware Player 2.0.4.

Streamlined the workflow when publishing a LivePC. Publishing no longer requires resubscribing to the LivePC.

Improved cache eviction algorithms for better cache utilization.

Added support for setting changelog entries within the MokaFive Creator application.

Fixed some issues when using MokaFive behind ISA Proxy.

Double-clicking the LivePC title will now take you to the web page for the LivePC.

Fixed an issue where LivePC download would stop at 99%.

Fixed a problem where LivePCs would show "calculating" for a long time.

Fixed an issue where a guest OS configured as NAT would stop resolving names after many connections.

Fixed an issue where cache resize could hang.

Fixed a situation where a USB LivePC could not be started on a Vista machine after it had been used on a Mac.

We recommend anyone using 1.0 to upgrade to the new version as soon as possible.
